BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

                                            This invention describes the isolation of a novel human B1 protein which can interact with, intracellular mediators or modulators of inflammation, cell death and/or cell survival pathways, directly or indirectly. Cells can be modulated or mediated in inflammation, cell death or cell survival pathways or another intracellular signalling activity using B1. Conditions such as AIDS and cancer can be treated using B1. Antibodies, oligonucleotides and ribozymes can also be used to regulate the above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180

                                                                   v68769-95 and Y68797-99 represent. human phosphorylation effectors (PHSP), designated PHSP1-PHSP1 (the protein sequence for PHSP28 is not given in the specification). The sequences were isolated from CDNA libraries prepared from various human tissues. The PHSP proteins are useful for the diagnosis, treatment and prevention of proliferative disorders, the diagnosis, treatment and prevention of proliferative disorders, pharmaceutical compositions which useful for treating or preventing disorders associated with decreased PHSP expression/activity. PHSP antigonists are useful for treating or preventing disorders associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SKSAPEGGTIIYMPPENYEPGQKSRASIKHDIYSYAVITWEVLSRKQPFEDVTNPLQIMY 240

C77607 to C78448 encode the human cancer associated proteins given in B4339 to B44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cycostatic; proliferative; vulnerary; immunomodulator; antidabetic; antiathmatic; antitinflammatory: antidabetic; antitinflammatory: antidabetic; antitinflammatory: contiting; antiallergic; antibacterial; antiviral; dermatological; antitingroid; antibacterial; antiviral; dermatological; corresponded; antipaoriatic and antiangiogenic. The polymotleotides and polympetides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polymotleotides, antibodies, aponists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in the exemplification of the present
               dermatological; neuroprotective; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic; antianglogenic; gene therapy; inflammation; immune disorder; haematopoletic cell disorder; autoimmune disorder; allergic reaction; graft versus host disease; organ rejection; haemostatic; thrombolytic; cardiovascular disorder; infection; neurological disease; drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               124

This invention describes the isolation of moves in a proteins and a partial murine CARD-12 and CARD-4 polynocleotides and proteins of partial murine CARD-14 protein and genes. The genes and proteins of partial murine CARD-14 protein and genes. The genes and proteins of the invention are involved in the regulation of caspase activation.

The caspase recruitment domain (CARD) polynocleotides, polypeptides, homologues and antibodies can be used in screening assays, detection assays, predictive medicine and therapeutic and probpylactic methods of treatment. The methods may be used to diagnose and treat patients which are suffering from a disorder associated with abnormal level or rate of complex, abnormal activity of the Fas/APO-1 receptor complex, abnormal activity of the Ras/APO-1 receptor complex, abnormal activity of the rank may be treated include cancer complex, abnormal activity of a caspase. Diseases that may be treated include cancer complex, and hormone-dependent tumours), autoimmune disorders (e.g. systemic lupus erythematosis, immune-mediated glomerulonephritis), viral in p53 and hormone-dependent tumours), autoimmune disorders (e.g. systemic lupus erythematosis, immune-mediated glomerulonephritis), viral infections, Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa, spindal muscular dystrophy, cerebellar celegeneration, anaemia, myelodysplastic syndrome, myocardial infarction, and stroke. CARD-3 protein interacts with other cellular proteins, and so can be used for regulation of cellular proliferation and differentiation and cell survival. The CARD proteins may also be used to for screen drugs or compounds which modulate their activity. The CARD-4F gene can express a long transcript that encodes CARD-4F, and CARD-4Z. This sequence control of the human CARD-4 spince variants, cardial in the method of the

This sequence is the human RICK (RIP-like interacting CLARP kinase)
protein of the invention. The RICK protein acts as a positive regulator
of apoptosis, potentiating apoptosis induced by caspase-8 and caspase-10
during CD95 signalling. The invention provides methods for identifying
apoptosis signalling pathway inhibitors and activators, and methods and
compositions for screening compounds which will modulate the interactions
of the various compositions identified: ACK, RICK, and the CIDE family of
activators (CIDE-A, CIDE-B and DREP-1). RICK is useful in screening
confositions for agents, useful in the diagnosis, prognosis or treatment of
disease associated with excess cell growth and dysregulation of
confositions complexes containing RICK and CLARP can be used in drug
screening assays to identify inhibitor molecules blocking CD95-mediated
confositions of the enzymantic activity of caspase-8.

Confosition of ARC-like inhibitory compounds may be useful for gene
therapy treatment of disease with increased cell death in muscole tissue
confosition of ARC-like inhibitory compounds may be useful for gene
therapy treatment of disease with increased cell death in muscole tissue
confosition of ARC-like inhibitory compounds may be useful for gene
therapy treatment of disease with increased cell death in muscole tissue
can deadiac disorders. Therapeutic compositions of CIDEs can be used
as reagents for the preparation or affinity chromatography
media, and for diagnostically measuring RICK levels: A specific inhibitor
confortion with intracellular factors such as CLARP and FADD appears to
confortion with intracellular factors such as CLARP and FADD appears
confortion with intracellular discorders.

Confortion with intracellular discorders are poptential drug candidates.
                                                                                                                                                                                                                                                                                       RICK; human; RIP-like interacting CLARP kinase; apoptosis regulator; ARC; caspase-8; caspase-10; C1095 signalling; apoptosis signalling pathway; C10E-A; C10E-B; DREP-1; diagnosis; cell growth; apoptosis dysregulation; gene therapy; cardiac disorder; cancer; neurodegenerative disorder; AIDS; aplastic anaemia; ischaemic injury; toxin-induced liver disease.

RICK; human; RIP-like interacting CLARP kinase; apoptosis regulator; ARC; caspase-8; caspase-10; CD95 signalling; apoptosis signalling pathway; cIDE-8; DREP-1; Atlanoais; cell growth; apoptosis dysregulation; gene therapy; cardiac disorder; cancer; neurodegenerative disorder; AIDS; aplastic anaemia; ischaemic injury; toxin-induced liver disease.

Human RICK protein sequence residues 248-531.

21-MAR-2000 (first entry)

```
Kinase) protein of the invention. RICK acts as a positive regulator

Kinase) protein of the invention. RICK acts as a positive regulator

Cof apoptosis, potentiating apoptosis induced by caspase-8 and caspase-10

during CD95 signalling. The invention provides methods for identifying

apoptosis signalling pathway inhibitors and activators, and methods and

compositions for screening compositions and activators, and methods and

compositions for screening compositions identified: RCK, RICK, and the CIDE family of

activators (CIDE-A, CIDE-B and DREP-1). RICK is useful in screening

cof the various compositions identified: RCK, RICK, and the CIDE family of

activators (CIDE-A, CIDE-B and DREP-1). RICK is useful in screening

cof assays for agents, useful in the diagnosis, prognosis or treatment of

disease associated with excess cell growth and dysregulation of

apoptosis. Complexes containing RICK and CLARP can be used in drug

screening assays to identify inhibitor molecules blocking CD95-mediated

apoptosis. Overexpression of ARC in an in vitro cell system can be used

confortification of ARC-11ke inhibitory compounds may be useful for gene

charapy treatment of disease with increased cell death in muscle tissue

confortification of ARC-11ke inhibitory compositions of CIDEs can be used to

charapy treatment of disease with increased cell death in muscle tissue

conformation with intracellular factors such as CLARP and FADD appears to

cof an essential step in the blochemistry of apoptosis is needed. RICK

interaction with intracellular factors such as CLARP and FADD appears to

be essential factors are potential drug candidates.

Confortions are potential drug candidates.

Confortions are potential drug candidates.

Confortions in the preparation of RICK binding to intracellular apoptosis factors are potential drug candidates.

Gaps

This sequence is a fragment of the human RICK (RIP-like interacting CLARP Kinase) protein of the invention. RICK acts as a positive regulator of apoptosis; potentiating apoptosis; induced by caspase-8 and caspase-10 during CD95 signalling. The invention provides methods for identifying apoptosis signalling pathway inhibitors and activators, and methods and compositions for screening compositions identified: RICK, RICK, and the CIDE family of activators (CIDE-A, CIDE-B and DREP-1). RICK is useful in screening compositions for agents, useful in the diagnosis, prognosis or treatment of disease associated with excess cell growth and dysregulation of apoptosis. Complexes containing RICK and CLARP can be used in drug compositions of apoptosis overexpression of ARC in an in vitro cell system can be used apoptosis. Overexpression of ARC in an in vitro cell system can be used to identify inhibitors of the enzymatic activity of caspase-8.

Conditional of ARC-like inhibitory compounds may be useful for gene therapy treatment of disease with increased cell death in muscle tissue and cardiac disorders. Therapeutic compositions of CIDEs can be used to therapy treatment of disease with increased cell death in muscle tissue can be used as reagents for the preparation or affinity chromatography can be used as reagents for the preparation or affinity chromatography can be used as reagents for the preparation or affinity chromatography can be used in the intracellular factors such as CLARP and FADD appears to apprecial parents in the blochemistry of apoptosis is needed. RICK and the preparation or affinity chromatography apprecase that for apoptosis of RICK binding to intracellular. apoptosis factors are potential drug candidates. Note: This sequence was created using information given in the 284 AA; specification Sednence

This sequence is a fragment of the human RICK (RIP-like interacting CLARP Kinase) protein of the invention. RICK acts as a positive regulator of apoptosis, potentialing and caspase-8 and caspase-10 during CD95 signalling. The invention provides methods for identifying apoptosis signalling pathway inhibitors and activators, and methods and compositions for screening compounds which will modulate the interactions of the various compositions identified: ACK, RICK, and the CIDE family of activators (CIDE-A, CIDE-B and DREF-1). RICK is useful in screening assays for agents, useful in the diagnosis, prognosis or treatment of disease associated with excess cell growth and dysregulation of apoptosis. Complexes containing RICK and CLARP can be used in drug screening assays to identify inhibitor molecules blocking CD95-mediated apoptosis. Owexpression of ARC in an in vitro cell system can be used to identify inhibitors of the enzymatic activity of caspase-8.

C identification of ARC-like inhibitory compounds may be useful for gene therapy treatment of disease with increased cell death in muscle tissue and cardiac disorders. Therapeutic compositions of CIDEs can be used to treat e.g. cancer, AIDS, neurodegenerative disorders, aplastic anaemia, ischaemic injury, and toxin-induced liver disease. AntirRICK antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RICK; human, RIP-11ke interacting CLARP kinase; apoptosis regulator; ARC; caspase-8; caspase-10; CD95 signalling; apoptosis signalling pathway; CIDE-A; CIDE-B; DREP-1; diagnosis; cell growth; apoptosis dysregulation; gene therapy; cardiac disorder; cancer; neurodegenerative disorder; AIDS; aplastic anaemla; ischaemic injury; toxin-induced liver disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequences F21614 - F22031 represent DNA sequences encoding human proteins
can be used as reagents for the preparation or affinity chromatography media, and for diagnostically measuring RICK levels. A specific inhibitor of an essential step in the biochemistry of apoptosis is needed. RICK interaction with intracellular factors such as CLARP and FADD appears to be essential for apoptosis, inhibitors of RICK binding to intracellular apoptosis factors are potential drug candidates.

Note: This sequence was created using information given in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; breast cancer; ovarian cancer; cytostatic; immunosuppressive; nootropic; neurpprotective; antiviral; antiallergic; hepatotropic; antidabetic; antinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; immune disorder; Addison's disease; allergy; autoimmune haemolytic anaemia; autoimmune thytoiditis; diabetes mellitus; Crohn's disease; multiple sclerosis; rheumatoid arthritis; ulcerative collitis; cardiovascular disorder; wound healing; neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human breast and ovarian cancer associated gene sequences and the polypeptides encoded by these genes, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular

(IMMV) IMMUNEX CORP.

```
breast and ovarian cancer. Included in the invention are sequences breast and ovarian cancer. Included in the invention are sequences ($72032 - $72040 and $859129 which are used in the isolation are sequences characterisation of the DNA and protein sequences of the invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive; nootropic; antidiabetic; antinflammatory; antiulcer; vulnerary; anticonvulsant; antidiabetic; antinflammatory; antiulcer; vulnerary; anticonvulsant; antidiabetic; antinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; breast and ovarian cancer. The nucleic acid sequences, particularly breast and ovarian cancer. The nucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment of immune disorders e.g. Addison's disease, allergies, autoimmune chircipal and ulcerative colitis; cardiovascular disorders such as mycoardial ischaemias; wound healing; neurological diseases such as erebral anoxia and epilepsy; and

The present sequence represents a murine death associated kinase protein, containing ankyrin repeats, designated DAKAR. The DAKAR polynucleotides containing ankyrin repeats, designated DAKAR. The DAKAR polynucleotides can be used to express the polypeptides, and as probes to identify mucleic acids encoding proteins having kinase activity. DAKAR polypeptides are used for purifying proteins, e.g. to measure protein activity, as quality assurance agents to monitor shelf life and stability of binding partner proteins; as research agents, e.g. in assays to determine protein kinase activity, to identify novel molecules involved in signal transduction pathways, and to identify therapeutic compounds which may interfere with a poptosis; as molecular weight and isoelectric focusing markers; as controls for peptide fragmentation; identification of unknown proteins, e.g. by comparison with proteins in databases; and for preparation of antibodies. The antibodies can be used in assays to detect the presence of the protein, and to purify the protein by immunoaffinity chromatography. The antibodies can also be used to block binding of the protein, and to purify the protein by immunoaffinity or enhance the kinase activity of DAKAR can be used to treat diseases characterized by overproduction or upregulated production of DAKAR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           21;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  287

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel nucleic acid sequences derived from rat dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying cells. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences V75942-Y76123 represent polypeptides encoded by cDNA sequences V75942-Y76121 represent polypeptides encoded by cDNA sequences V75942-Y76121 represent polypeptides and hair cell ypes. Sequences V75942-Y76121, Y76020-Y76021, Y76019 and Y76104-Y76102 are proteins with one or more putative transmembrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Murison JG;

The invention relates to novel nucleic acid sequences derived from rat dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, Keratinocyte stem cells and translat amplifying cells. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate anglogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences V5543-Y7613 represent polypeptides encoded by CDNA sequences derived from several mouse, rat or human skin cell types. Sequences Y7544-Y7547, Y7602-Y7601, Y76044-Y76104 and Y76119 are proteins with an N-terminal signal sequence. Indicating that they are secreted. Sequences Y7586-Y75989, Y76061-Y7601, Y76109
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20;

The sequence represents translation (reading frame 3) of Genesis clone 971025TRAMO04820HT (see 258584). The invention relates to purified murine polypeptides having kinase function (see Y79152-56) and isolated nucleic acids encoding them (see Z58582-86). Claimed vectors comparising the novel nucleic acids, and claimed host cells (bacterial, yeast, plant, insect or animal) transfected or transduced with the vectors, are used to produce the polypeptides.

The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of

                                                                                                                                                                                                                                                                                                                                                                                                                         The kinase polypeptides and their fragments are used as mol.wt. and isoelectric focusing markers, and as controls for peptide fragmentation. They also have a number of therapeutic uses, as kinases play a central role in cellular signal transduction. As such, alterations in kinase expression and/or activation can have a profound effect on a plethora of cellular processes, e.g. prolipeptides could also be used to identify binding partner proteins, or as reagents to identify proteins that regulate or interact with them. They may also be used for preparation of antibodies useful for detection, purification, and for blocking binding of kinase polypeptides to their binding partners.
